### **DETAILED ACTION**

1. Claims 1-6 are presented for examination.

#### ***Information Disclosure Statement***

2. This office acknowledges receipt of the following items from the Applicant:  
Information Disclosure Statement (IDS) filed on July 08, 2004.
3. Information disclosed and list on PTO 1449 was considered.

#### ***Reasons for Allowance***

4. Claims 1-6 are allowed.

The following is an examiner's statement of reasons for allowance:

Claims 1-6 include allowable subject matter since the prior art made of record and considered pertinent to the applicant's disclosure does not teach or suggest the claimed limitations. Black et al. (U.S. Patent No. 6,343,032), Black et al. (U.S. Patent No. 6,317,359) and others, does not teach the claimed invention having a latching circuit that senses and latched the magnetic states of a first bit line and second bit line in a MRAM comprises a fourth switch having a first switching terminal, a second switching terminal and a control terminal, wherein: the first switching terminal of the fourth switch is coupled to a second portion of the first bit line; the second switching terminal of the fourth switch is coupled to the second switching terminal of the second switch, to the control terminal of the first switch, to the control terminal of the third switch, to the second terminal of the reset circuit, and to the second output; and the control terminal of the fourth switch is coupled to the control terminal of the second

switch, to the third terminal of the reset circuit, to the second switching terminal of the first switch, to the second switching terminal of the third switch, and to the first output as claim 1 discloses, and a method of reading a (MRAM) comprising temporarily resetting an interface circuit coupled to both the first bit line and to the second bit line such that an output of the interface circuit is reset to a balanced state as claims 2-4 disclose, and a method of latching a (MRAM) cell, having in a reset state, disabling cross-coupled feedback of an interface circuit coupled to a first bit line and to a second bit line, where disabling the cross-coupled feedback balances the interface circuit to current applied through first and second portions of the first bit line and through first and second portions of the second bit line, where the current applied to the first bit line and the current applied through the second bit line are substantially equal, where the first bit line corresponds to the MRAM cell as claims 5-6 disclose.
